Honduras Industrial Power Peak Shaving Energy Storage

What is peak shaving? Peak shaving involves selectively transferring specific loads within a facility from the grid to an energy storage system. This process is accomplished by disconnecting the power supply of a specific load(s) from Source A (typically the grid) and connecting them to Source B (an energy storage system). Can peak shaving reduce energy costs? Modern consumers actively seek cost-effective energy solutions and sustainable practices. This white paper explores peak shaving as an effective method to minimize energy costs. Energy and facility managers will gain valuable insights into how peak shaving applications can help unlock the full potential of energy storage systems. What is a peak shaver? It is offered in the screw, push-in spring, and ring tongue connection types. It also has a built-in surge suppression and has easy-to-use accessories through snap-to-connect function. Peak shaving is critical in supporting more sustainable electrification while managing costs. What is the difference between peak shaving and load shifting? It is essential to differentiate peak shaving from load shifting. Load shifting involves adjusting energy consumption patterns or postponing electricity usage to a later time. Base Peak shaving, sometimes called load shedding, involves reducing the peak electricity demand to lower demand charges. Why is peak shaving unbalanced? Due to the cost of deep peaking of conventional units, the system needs a larger charging power provided by ES to participate in peak shaving when the power of RE is larger (e.g. Fig. 7 (Typical day 3 to p.m.)). In this way, the charge and discharge of ES involved in peak shaving may be unbalanced. Should peak shaving be a strategy? BESS is one of the most effective ways to achieve a sustainable future. The decision to adopt peak shaving as a strategy should be carefully assessed by consumers on a case-by-case basis. Peak shaving is particularly relevant in regions where Time-of-Use (TOU) rates are implemented by electric utilities and where demand charges are substantial.
